FREQUENTLY ASKED QUESTIONS ABOUT SENTRICON® ALWAYSACTIVE™

Q: How is Sentricon AlwaysActive different from other methods of termite protection?

A: Current termite management systems are either a chemical barrier or a baiting system. Sentricon AlwaysActive combines the best of both. Discreet Sentricon stations around the structure effectively form a continuous barrier. The Sentricon stations contain Sentricon IG Termiticide Rods, making it active immediately upon installation. Termites may begin to be eliminated before they are discovered. Sentricon AlwaysActive offers the safety of a baiting system and the immediate protection of a chemical barrier.

Q: How does Sentricon AlwaysActive work?

A: Sentricon AlwaysActive contains hexaflumuron which is a chitin synthesis inhibitor. Termites prefer Sentricon AlwaysActive over wood, so when the workers begin feeding on the Sentricon station, they share the hexaflumuron with the colony. When termites next moult, they die as their new exoskeleton (made of chitin) is not strong enough. Without worker termites, the rest of the colony dies. The proof is in 30 independent university studies and 60 published scientific articles.

Q: Why is it called AlwaysActive?

A: Sentricon IG Termiticide Rods are in the Sentricon stations all the time offering immediate, continuous and lasting protection. Sentricon is highly durable, and highly desirable. In palatability tests and field trials termites preferred Sentricon AlwaysActive over wood and liked it even better when it got old, cracked and mouldy.

Q. How long does AlwaysActive last?

A: Sentricon IG Termiticide Rods have been shown to be effective for up to five years in Australian conditions. We recommend a full review of the system five years after installation.

Q: How can I use Sentricon AlwaysActive?

A: Sentricon AlwaysActive can be used pre or post construction, as a remedial or protective treatment.

Q: What about installation?

A: Installation is quick and easy. Sentricon stations are placed every 3 meters around the perimeter of the structure. The Sentricon Ready-To-Install (RTI) Station is sold with the Sentricon IG Termiticide Rod already loaded. So all that is required is to auger a hole, take the Sentricon RTI Station out of the box and insert it into the hole. There is no mixing, wetting or moisture required.

Q: Is monitoring still required?

A: To ensure continuous protection it is important to monitor the Sentricon stations every 3 to 6 months during the warmer months and every 6 months when it's cooler. A Sentricon IG Termiticide Rod should be replaced when half or more has been consumed.

Q: My site already has baiting stations, can I use Sentricon AlwaysActive?

A: Yes, Sentricon IG Termiticide Rods can be retro-fitted into any baiting station system that has been properly installed around a structure.
