

Sulfomac™ (750 g/kg Sulfometuron Methyl)

Product Profile
Sulfomac is a broad spectrum herbicide that can be used for the control of annual and perennial grasses and broadleaf weeds in commercial and industrial areas, rights of way including road, rail and utility lines, *Eucalyptus* spp. and *Corymbia* spp. plantations.

Sulfomac is primarily a soil residual herbicide with some knockdown action. It controls susceptible weeds through both post-emergence and pre-emergence (residual) action.

Sulfomac may be applied pre-emergence or post-emergence to the weeds; best results are obtained if application is made before or during the early stages of weed growth.

Sulfomac may be applied in non crop & industrial situations e.g. application to roadsides, fire break areas or around roadside furniture - Follow the Industrial use recommendations on the label.

Care should be taken to avoid **Sulfomac** application in areas where movement could cause off target damage. Under certain conditions- such as when soils are saturated with moisture or during periods of exceptionally heavy rainfall, residual herbicides may wash to non target areas.

Features	Benefits
❖ Favourable environmental fate characteristics.	✓ **Sulfomac** degrades in the soil by both chemical and microbial processes. Does not accumulate in the environment or the food chain.
❖ Minimal potential for accumulation in groundwater.	✓ **Sulfomac** (active ingredient sulfometuron methyl) is substantially less likely to concentrate in groundwater than other commonly used Vegetation Management herbicides.
❖ Performs well with a coarse spray droplet application.	✓ Helps reduce drift potential.
❖ Active ingredient application reduced by 95 percent to 99 percent relative to higher use-rate products.	✓ Low dose rate reduces manufacturing and packaging waste and allows easier handling, storage and transport.
❖ Works by inhibiting an enzyme only found in plants	✓ **Sulfomac** is safe to the user and native animals, birds, insects and fish.
❖ Variable rates – broad registration.	✓ Allows flexibility in selecting the length of control and provides multiple use situations with the same product.
❖ Compatible with most partner herbicides.	✓ **Sulfomac** can be mixed with **Macspred Glymac Dri 700** (glyphosate) herbicide when spraying established weeds to achieve a superior level of knockdown & extended residual weed control. ✓ The compatibility of **Sulfomac** with other residual herbicides gives a cheap and effective solution to extending the control of some hard to kill weeds and broadening the range of species controlled. **Sulfomac** is also effective as a directed or shielded spray in post plant weed control operations.

DISCLAIMER: We make every reasonable attempt to ensure the accuracy of all statements made in this brochure. However, it is impossible to know the impact our products or the advice herein may have in your situation without first speaking with you in detail. The only way we can ensure that you receive the correct products and advice and the only way you can protect against unsuccessful and/or unwanted results is to speak to us in detail concerning your circumstances and requirements and follow the recommendations / instructions which appear on all product labels. We must therefore disclaim any responsibility for all statements and advice contained herein as well as any actions you may take having read this brochure. Accordingly, we strongly recommend that you closely follow all label directions and speak with us before using any of our products or relying upon any of the advice here in.
